Perforce is the preferred integrated enterprise software configuration management system. Perforce is designed from the ground up to meet the needs of the software development community. The Perforce Server provides central, scalable software configuration management over a LAN or wide area network. The Perforce Client is a stand-alone command-line application that supports numerous operating systems, and can provide a more intuitive development environment for end-users. We can see the word Perforce in a lot of Software. A: It is a code named for the Perforce client, a sort of DOS-like explorer, which is useful if you have complex repositories. The client should never be used to interact with the server as it is not designed for this. A: P4 (Perforce Software Inc.) is the company that develops the product. Perforce is a suite of tools for software configuration management (SCM). As @delnan said, the client is what you use to interact with the server, not the other way around. The client is a set of tools (or a GUI, as the client for a particular platform might be called) to help you interact with the server (and the repository). Stemming from a direct request from the Commissioner of Field Operations for the St. Louis Cardinals during the first offseason of the 10th anniversary of the 2005 World Series Championship, Larry Reynolds was tabbed to build a batting cage for the Cardinals' complex. Reynolds was given \$1 million and told to build a home for a team that had never had a batting cage before. The Cardinals owner at the time of the hire, Thomas O'Connell, promised Reynolds \$1 million and \$1 million more if the batting cage was deemed a success. The plan was to have the batting cage be open to the public to allow the community of the Gateway City to enjoy some of the biggest Cardinals fans in the country in a more comfortable setting. Reynolds received the keys to the project and started work on the largest batting cage in the entire complex. The actual construction of the cage was supervised by a construction crew that worked in the Gateway City for over a decade with Reynolds and his crew. The full construction lasted a little over a year, and the whole construction of the cage was completed in July of 2006. Now more than 3 years later, the cage is a home to numerous kids around the Gateway City. Reynolds holds a yearly open tryout event to anyone who is

History In October 1996, Source Code International announced its Perforce Server product at the EuroSourceSoft conference in Munich. The Perforce Server was delivered to customers in November 1996. Patents Along with Source Code International, a subsidiary of Network Computing, Inc., Perforce has many patents related to the architecture and content of its software configuration management solution, including: Software product version control (20 August 1994) Method and apparatus for accessing source code version history (19 March 1995) System and method for improving network software development using source code version history (5 December 1995) System and method for perforce based distributed software development using source code version history (21 July 1996) Self-contained software product version control (26 January 1997) System and method for viewing a graphical representation of source code history (16 March 1997) Workstation-based version management (16 March 1997) See also Perforce References External links Perforce Document Archive Category:1996 software Category:Version controlQ: How to store multiple query variables with MVC3 I have a mvc3 controller and inside the action method I have a method called Search which gets a parameter of type int?. The user enters a value in this field and clicks submit. After that I want to store that value in a string variable. But I dont know how. Thanks in advance A: Call the string variable to store the value: string value = "your variable name" I think you should do this at the end of the method: Request.QueryString["variableName"] A better approach would be to create a class to store the value. Create a variable in the class, and assign the value to it. In the class, when you use the variable, you'll get the value. So when you change the value of your variable, it'll update the value in the class too. A French court has ruled that the State must pay €400m (£355m) in compensation to relatives of a two-year-old boy who was murdered by a Muslim immigrant. Three years ago, a Tunisian man of Algerian origin, Yassine B, crept into the south-eastern town of Poitiers and stabbed Louis Camilleri and his wife Paule, then aged 22 and 24. They were only eight months into their

Perforce is a comprehensive software configuration management system for building and managing source code and the release schedule of software projects. It uses the binary file or binary delta data model to represent the information required to manage software projects. Perforce works by keeping a database of all the files, versions and other data of a project. The changes and versions between two states in a project are referred to as 'deltas'. A delta records all of the changes that were made since the previous version, including actions, and the date and time that the change was made. With a history of all the changes and versions of a project, a project can be reverted to a previous state at any time. A developer can also continue working on a project by making changes and submitting them to the server, where they are then updated to the latest version in the Perforce database, and are made available to other team members. The Perforce SCM System Benefits:

- Perforce's client/server architecture makes it easy to install and manage a Perforce server.
- Applications written to the Perforce protocols are always reliable, as they are not dependent on a particular server configuration.
- Perforce's client/server architecture means that it can be used on a variety of platforms, from mainframes to personal computers.
- Perforce uses a binary data model, which represents changes to files as deltas rather than.diff files, making it possible for a distributed team to work on the same files simultaneously without the risk of corrupting each other's work.
- The Perforce client/server architecture is extremely flexible, and can be used to build custom clients for large distributed sites, or to provide a simple client for use by one or two developers on a stand-alone PC.
- Perforce can be used as part of a complex, highly distributed version control system, or it can be implemented as a standalone file version control and revision control system.
- Perforce is available on over 50 operating systems, including UNIX, Windows, and Macintosh.

The Perforce SCM System Challenges:

- Perforce's binary delta data model doesn't work well for revisions of the same file.
- Perforce's binary delta data model, although generally a good idea, is not necessarily a simple one.
- Perforce's database is dependent on the program which runs it, making it impossible for any Perforce database to be both portable and convenient.

The Perforce Systems Architecture Overview: The Perforce SCM System Architecture is based on the concept of state machines. A state machine encapsulates a set of possible states of the system. A state machine typically consists of three parts:

- A set of states, which describe the current state of the system.
- A set of transitions, which link the states together.
- A set of events, which occur when a state is entered or exited.
