The same was also observed for the blue phosphor ITO-ZnO on its glass substrate. The results obtained for the blue phosphor ITO-ZnO on its ITO substrate showed the good properties of ITO in terms of an ideal match between the electrical work function and the surface potential of the polymer. The ITO layer was grown with a good degree of perfection, allowing us to observe the uniformity of the ITO layer on the glass substrate. The ITO layer is also continuous and pinhole free, without the presence of bubbles. The annealing treatment, performed in the temperature range between 400 and 600 °C, significantly reduced the roughness of the ITO layer. The ITO layer was grown on the glass substrate with a thickness of about 10 nm. The nano-sized ITO particles with a diameter of 2.1 nm were visible for the initial deposition of the ITO layer on the glass substrate ([Figure 2](#materials-13-03429-f002){ref-type="fig"} a).
