Amphiastrum *Amphiastrum* is a genus of flowering plants in the legume family, Fabaceae. The name *Amphiastrum* is from the Greek word *amphiastos* meaning 'half-unfolded' from *amphi* meaning 'both'. The name *Amphiastrum* was first used for the common buckbean, (*A. hirsutum*) in 1753 by Carl Linnaeus the father of modern taxonomy. *Amphiastrum* can be characterized as a native desert plant group of the Americas, as they are found only in mesic areas of open deserts and plains in the arid regions of North America, the Mesoamerica, and the Chihuahuan desert in Mexico. There are 52 species in the genus. **Description** *Amphiastrum* species are generally small shrubs or small trees, growing to a height of up to 10 meters. Their leaves are

generally divided into three leaflets, with their blade length, width and shape varying according to species. The flowers are small, white, with a darker colored, cup-shaped calyx, with five segments. The petals are five, with the mid-petal with two lobes. The ovary is usually four-valved. *Amphiastrum* are pollinated by bee species such as *Bombus*, *Ceratinus*, *Geniapis*, and *Xylocopa*.

Ecology The plants are considered part of the annual flora group in the Sonoran desert, and they are pollinated by hoverflies, bees, wasps, and beetles. An abundance of their flowers are visited by vertebrate pollinators. Birds and bats include Andean lark, nutting avocet, black kingbird, rusty-tailed jay, cupwing wrinklebill, Western whimbrel, short-eared owl, long-tongued nectar bat and rough-skinned newt. Being desert plants, they have to rely on entomophily in order to reproduce. The flora group grows from 300 m on the sea level to more

than 2500 m on Mount San Jacinto in the southwest of the USA. The plants can grow in a wide range of ecological conditions, from sunny, dry conditions to water-saturated ones. Some species grow with the help of underground rhizomes, with water seeping from the ground below the surface. Taxonomy Amphibiastrum Sub
