Deeproot Plant Base is a comprehensive database of all the plants you have ever studied in the botanical field. This software tool collects information such as family, origin, growth, or color, as well as pictures associated with the plant. As part of the Insects collection, the software has been created to help in the identification of your visitors, the bookworm beetles, the caterpillars, the wasps, and many other insects. The Insects Collection has been fully developed to be useful for the most novice collectors, and to help even the most experienced in the field. This Insects Collection allows the identification of insects using a comparative analysis of different features, and in order to help you determine their respective status. This tool has been developed in three different ways:

- Comparison with a model, or an image of the insect from the imago stage
- Comparison with a digital image
- Comparison of a digital image with an image of the insect from the imago stage

The first analysis uses a picture of the insect in the imago stage in a comparative analysis of its features, while the last two are based on an image from the imago stage that has been translated into the measurements of the insect itself, in order to determine its status and consequently advise whether it should be caught, or not. In order to simplify the identification of the insects, the Insects Collection has been classified into eight different categories, of which most insects are grouped under their own tab in the software. The other insects are grouped in the Insects tab, in a comparative analysis that will help you determine the overall status of the insect. In the collection of the insects, there are various techniques that are used in order to facilitate the search, including a database of the various characteristics of the insects, such as sizes, colors, and habitats. Also, there are images of the insects in various stages, as well as icons that provide you with the information related to each insect. The Insects Collection is a fully-featured, easy-to-use software solution that allows you to compare insects from the imago stage with the model that you are most familiar with, as well as a variety of images that you can save and work with at your convenience.

The Insects Collection Description: The Insects Collection allows you to compare the images of the insects that you want to identify with a model, and compare the insects that you are interested in with an image taken from the
