Windows Azure Tools for Visual Studio is a free extension that allows you to develop and deploy Windows Azure applications quickly and easily. This extension integrates into Visual Studio and provides a simple development and deployment environment

that makes it easy to get started with the Windows Azure service. This includes the ability to: The use of radio frequency identification (RFID) for inventory control and tracking of objects in inventory are well known. RFID tags typically comprise a radio frequency (RF) transmitter, an antenna (for receiving RF transmission) and a microprocessor for storing and processing information received by the RFID tag. One example of a RFID tag is a transponder tag that comprises a read/write non-volatile memory to store and process information, such as for example, an identification number, that may be read from or written to the tag by a reader and recognized by a computer system as the identity of the item to which the RFID tag is attached. Typically, the antenna and the read/write memory are contained on a microchip. The RFID tags are typically attached to the objects to be inventoried. In many RFID systems, a reader transmits a radio frequency (RF) signal to the tag that may cause the tag to modulate and reflect the RF signal back to the reader. The reader may also generate a magnetic field to power the RFID tags.

As the RFID tag reflects the incoming RFID signal, the reader may receive the reflected RFID signal to identify information stored on the RFID tag. As readers utilize frequency bands that are shared by other communication systems, information stored on RFID tags may be inadvertently read or written by other communication systems. For example, it is known for certain radio frequency (RF) readers such as those that utilize a 13.56 MHz or 12.24 MHz communications protocol to share the frequency band with microwave ovens that utilize a 2.4 GHz communications protocol. If the RFID tags are attached to a microwave oven, the information stored on the RFID tag may be read or written by the microwave oven. In an attempt to address this security risk, US Patent Publication No. 20020144957 to Sandia Corp, discloses a method for preventing unauthorized writing of information onto an RFID tag. The system comprises a transponder module having an RFID tag and a memory coupled to the RFID tag. The transponder module further comprises a power supply source, an output driver, a sensing subsystem, a comparator circuit and a logic circuit for

Azure cmdlets that are new or different than what can be found in the Windows PowerShell ISE. Editors that are newer than the Windows ISE. Azure Core providers that are in the same way as other WinRM or IIS PowerShell providers, however they do not include the required modules for everything. The Azure PowerShell ISE is not a stand-alone tool, and it cannot be installed through the Windows Installer as it would be for the ISE. It uses the WindowsInstaller.msi that can be downloaded from here. Installation is similar to the ISE: Install the WindowsAzure PowerShell module from the PowerShell gallery. Run WindowsAzure PowerShell from an elevated PowerShell console. Let's see a quick example of usage: # Remove current module from local Remove-Module -Name Azure* # Install WindowsAzure module from gallery Install-Module WindowsAzure # Connect to the Azure subscription Connect-AzureAccount # List all available resource groups Get-AzureRmResourceGroup -Filter "Name -eq *" | Select -ExpandProperty Name | Out-File -Path "c:\azure\rg.txt" -Append # List all available storage accounts Get-AzureStorageAccount -StorageAccountType 'Standard_LRS' -Location 'West US' | Select -ExpandProperty Name # Get an existing storage account with a name starting with a number \$storageAccount = Get-AzureStorageAccount -StorageAccountType 'Standard_LRS' -Location 'West US' -Name 1 # Get an existing storage account with a name starting with a number \$storageAccount = Get-AzureStorageAccount -StorageAccountType 'Standard_LRS' -Location 'West US' -Name '#1' # Get an existing storage account with a name starting with a number and without a hyphen \$storageAccount = Get-AzureStorageAccount -StorageAccountType 'Standard_LRS' -Location 'West US' -Name 'Number1' # Get an existing storage account that doesn't exist Get-AzureStorageAccount -StorageAccountType 'Standard_LRS' -Location 'West US' -Name 'Number1' # Create a new storage account and provide a name.
