It is copied from the Chapter 6 source code file. The main method is located between the curly braces, but the other methods are included above it. A few methods have been commented out because they are now redundant. The code includes all the methods you have used so far. Of course the one new method you just created is included, as you can see from the ``public static void main(String[ ]args) '" statement. The following shows the output of Grammar Editor. The parse tree and the input text should be straightforward. The Example 6-2 output looks like this: 1. when does the fun in syntax begin? 2. fun is like cowrie shells 3. You might not have been able to see the logotype (cover image) and also the font size above because of the formatting of the source code. Simply copy the output from Grammar Editor and paste it into a text editor (such as Wordpad) to view the logotype and font size. Grammar Editor is free, open source software. The program is written in Java and is very easy to use. It has two main areas: The blue area shows the grammatical structure. The trees are drawn as lines with dots (pennies) at the places where the grammar rules would be applied in the sentence. The yellow area is a dialog box where you can enter text to test the grammar. The program computes the grammar from the text, and displays the parse trees. The grammar format works as follows: There is a grammar that specifies a list of rules (a.k.a. the grammar) and a reference grammar. For example: [FORMAL] [?x:x(y) = x :x(y) = x + Y, ?x(x) = x :x(x) = X] This grammar defines a rule ```x(y) = x + y.'' If the parser finds an application of ```x(y) = x + y'' in a sentence, it replaces the rule with the application ```x(x) = X.'' Thus the grammar is obtained from the reference grammar. Input files can have notes, just like a grammatical handbook. Just put a note in the ``Note:'' area. The program also works on a selected region of a file, just like a revision function. So the program automatically changes all the grammar descriptions in the selected region. Additional features in Grammar Editor: The parser can be run in parallel by specifying the number of processors (not a good idea). The interfaces can be serialized to be used in a networked environment. Grammar Editor Features: Input a grammar, or a grammar and a file. Output a parse tree (a.k.a. a parse forest). Very easy to use. Visual editing of grammatical trees (for the students). Display of notes and comments (for the students). Test of grammar and parse in a graphical way. Edit a grammar, or set of grammars. Allows you to make grammars from text. Input multiple grammars (for students). Parse sentences from a file (for students). Interfaces with the other Java applications. Grammar Editor is distributed under the LGPL license. The following is a brief description of each area and tool: Area 1: Input Grammar
