Cardiovascular disease (CVD) is the single leading cause of death in the United States. More than 90% of CVD deaths are due to coronary artery disease (CAD). The exact mechanism behind CAD is not well understood. However, cholesterol is a well-known risk factor. The most commonly used class of lipid-lowering medications is the statins, which reduce cholesterol by inhibiting the enzyme HMGCoA reductase, the rate limiting step in cholesterol biosynthesis. This enzyme is the subject of the present study. HMGCoA reductase is a member of the short chain dehydrogenase superfamily of NAD-dependent enzymes. It is located in the mitochondria and converts HMG-CoA into mevalonate, a five carbon isoprene unit critical for cholesterol synthesis. As shown in FIG. 1, HMG-CoA is first converted to mevalonate by the action of HMG-CoA synthase, a cytoplasmic enzyme. The hydroxymethyl group of HMG-CoA is transferred to tetrahydromevalonate (H4MV) by HMG-CoA reductase, which is then converted to mevalonate by the isomerase activity of HMG-CoA reductase. Mevalonate is then converted to farnesyl diphosphate (FPP), which is the precursor to all isoprenoid units, including cholesterol. Mevalonate is also the precursor to the dolichol and geranylgeranyl units. The dolichol unit can be converted to protein O-linked glycans and the geranylgeranyl unit to prenylated proteins, including the Ras family of proteins (Bartness, E. A., et al., Chapter 5 in Isoprenoids and Other Metabolites, H. R. Burlingame and T. K. Chiu, Editors, Academic Press, 1996.

* Continues of the Indian Ocean tsunami. Transas '99 Full version. Transas '99 single version. Transas Tsunamis '99 dongle Version: 2.0.5 Self-Assembled Layered Tandem Cavities Aligned to High-Brilliance Mie Modes for High-Resolution Vortex Patterns. Herein, we report a layered cavity device, in which the cavities can be precisely arranged in a manner such that a large number of high-brilliance Mie modes are excited simultaneously. The surface patterning of the inner walls of the two layers simultaneously enables the precise spatial arrangement of the layered cavities. The excitation of the high-brilliance Mie modes simultaneously leads to a large mode overlap, resulting in an improvement of the resolution of the optical vortex patterns. Based on the approach, we expect to find novel applications for the generation of other coherent non-diffracting beams in the visible and near-infrared regions. Q: HP server software is there a server operating system built in to a HP server, or do you have to install a different one? A: Yes, there is HP-UX and zLinux. You can download both of these free. A: Yes, you can get HP-UX and zLinux. (I'm no fan of either... OS R&D made a big mistake by building the "big iron" around a heavy-duty OS: I'd rather have a nice low-end desktop PC than a cracker-barrel server...) But if you want a low-cost server platform without too much bells and whistles, there's always several available in various forms. You can get a cheap PCMCIA card or compact PCI card for use with a PC, for example. (As an added bonus, these "cash-tree" or "dollar-tree" systems are often designed to be dual-bootable.) If you're really strapped for cash, you can get a single-board computer for about \$40 (but they have different "flavors"; AFAIK they're all single-board systems). All of these systems are available from Digi-Key for under \$200. A: They make OpenVMS which is a lot like Solaris. It's also free. Check it out on HP's site. 3e33713323
