What's New in the?

This is the second of my InstallShield tutorials. The first InstallShield tutorial is about the basics of creating a custom

installation package including some of the more advanced features such as Save As, Custom Action, MSI-specific properties, etc. Simple Install Scripts Installing the basic elements of an InstallScript file (as described in "Basic InstallScript Code") is quite easy. Although for the purpose of following my tutorial, you may download a pre-compiled example that contains all the

necessary source code to make it easy to follow. For users who are more experienced, it is also possible to generate an InstallScript from the information provided below. In the simplest case, you will need to start with a classic Custom Action that extracts the relevant data from an installation and saves the data to a property. Custom Actions More information can be found on

MSDN regarding custom actions. For the purpose of this tutorial, I am only looking at the INI section of the article. Introduction Each custom action is called when the installation starts up. The INI section can be used to store information in a file used by the installer. There is also another INI section called INI File Routines. This can be used to provide a default value for

one or more properties when there is no entry in the Property Table. Custom Actions INI Section It is also possible to store a custom action in the Custom Actions section. This is a list of the custom actions that are called at different stages during an installation. This tutorial will not go into the details of this section. Please refer to the MSDN article for more information. Custom

Actions INI File Routines Section The default value for the property MyProperty in a Property Table can be obtained using the following code: The values of INI Section settings can be viewed using the following command: Setup.exe /ISeeSettings If the above command displays Property name:MyProperty Property value:Same value as default You have successfully set the

Property Default value to the same value as it was originally set during Setup.exe configuration. However this is not the most direct way of setting the property default. Another approach is to use a blank property definition in the Property Table and use this to set the Default value. An alternative approach is to use the default value of 0. In the Property Table a set of blank

Property Definitions can be found, one

System Requirements For Sourceforge Projects Monitor:

Macintosh model with a 64 MB or greater Mac OS X compatible computer. If you have an older computer you may be limited to a slower data transfer rate. USB or Firewire Firewire 800/Firewire 800i. Some Firewire 800 cards will work in the Firewire 800i ports of older models. It is not recommended to use Firewire

400 cards. A monitor capable of displaying 640 x 480 pixel resolution Satellite TV service including HughesNet, Comcel, and Tandberg with Avermedia Digibox
