

AutoCAD is widely used by architects and designers. In 2016, Autodesk was the number one CAD software developer, number four globally in total, with revenue of \$2.9 billion in 2016. Key Takeaways "AutoCAD" is a trademark of Autodesk. The company sells CAD software, and also offers other software solutions, services, and products. AutoCAD was first introduced in 1982. In 2015, AutoCAD was the world's most-used CAD software. AutoCAD can be used for architectural design, civil engineering, construction, mechanical design, and other tasks. AutoCAD is also used to produce technical drawings for internal use and the delivery of construction drawings, such as in construction planning, design, contract administration, and construction. AutoCAD can produce architectural, civil engineering, construction, and mechanical plans and elevations. AutoCAD is able to import and export to other CAD applications. AutoCAD 2018 and 2019 AutoCAD 2018 and 2019 are both available for desktop and mobile platforms. The 2019 release of AutoCAD has improved the new advanced commands, which can automate tasks, and offer expanded interoperability with other software programs, such as CorelDRAW. AutoCAD 2019 can also import and export to other CAD applications, such as MicroStation, Revit, Revit Architecture, and SketchUp. There are also new improvements to 3D modeling in AutoCAD. This includes support for cadastral surveying, plus a new "Vector Interoperability" feature that allows AutoCAD and 3ds Max data to be imported into each other. Mobile versions of AutoCAD are also available, including the iPad, iPhone, and Android. Architectural plans and drawings AutoCAD is a popular CAD software used for the production of architectural plans and drawings. The software is used by architects and engineers for design, documentation, and construction. It is a useful tool for design and drafting, as well as for specifying, scheduling, building permits, and interior planning. The architectural plans or drawings produced with AutoCAD are usually 3D drawings, often referred to as architectural 3D. The drawings can be paper plans or construction documents, and can be floor plans, blueprints, elevation drawings, and similar documents. AutoCAD can produce these types of drawings for a variety of structures,

Collaboration AutoCAD can be used by multiple people simultaneously within a single workgroup to gain efficiencies and improve productivity. The 2009 release of AutoCAD supports multiple-view tools, which allow the designer to toggle between various views. AutoCAD 2007 introduced the ability to view files in the OpenOffice.org Calc spreadsheet format, enabling users to view engineering drawings with an Excel-like view. In addition, AutoCAD 2007 introduced the ability to view files in Adobe Portable Document Format (PDF), enabling users to view documents such as PDFs on the computer screen without opening the entire file. AutoCAD 2012 introduced a new collaborative and collaborative editing mode. The collaborative editing feature is designed to allow users to work on a design document together from different devices and view information on different levels of detail. The feature also enables users to share individual drawings and make changes to the design that can be viewed and viewed by the other users. This feature was introduced in AutoCAD 2012 as part of the "pencil" feature that allows users to draw over files and erase mistakes on the fly. Trademark dispute In 2014, a Maryland circuit court ruled that the word Autodesk is a valid trademark. The court ruled that the word Autodesk is a valid trademark for CAD software as well as Autodesk software for which Autodesk's registered the trademark. This invention relates to the manufacture of oriented thermoplastic sheets, and particularly to the manufacture of biaxially-oriented sheets of polypropylene. Biaxially-oriented polypropylene sheets are employed in various applications, particularly as packaging material. Such sheets are generally manufactured from high-strength biaxially-oriented polypropylene sheets which are obtained from essentially isotactic polypropylene. The high-strength biaxially-oriented polypropylene sheets are usually manufactured by subjecting isotactic polypropylene to biaxial drawing in a heated state and then quenching the drawn sheets. Biaxially-oriented polypropylene sheets are preferred to those of isotactic polypropylene sheets for their excellent mechanical strength, solvent resistance, heat resistance, etc. In order to manufacture the biaxially-oriented polypropylene sheets, it is necessary to employ a biaxially-oriented sheet extruder for the extrusion of polypropylene, and a calender for the quenching and subsequent stretching of the extruded sheet. These processes are highly complicated and costly. Japanese Unexamined Patent Publication (Kokai) No. 60-94101 describes a process for the manufacture of a non-oriented sheet made of isotactic polypropylene. According to the process, polymer material in the form of flakes is fed in a molten state to a melt-extruding device where it is extruded in the form of fibers. The extruded fibers are subjected to a compressive force to form a sheet of flaked polymer material. The sheet is stretched and then dried in a manner such that a composite sheet having flakes and fibers is formed. The composite sheet is cut into sheet-like pieces and then the sheet-like pieces are arranged to form an endless sheet. The endless sheet is heated to the melting point of the polymer material and then stretched. The above process is disadvantageous in that the sheet has a low mechanical strength. In the sheet extrusion step, there must be prepared an extruder having an elongate die, and an endless belt-like squeeze roller for
