Description: The swine influenza test is a diagnostic application that can help you detect the status of your health. It is an intuitive application that will ask you 7 questions. Each question corresponds to a symptom of the influenza A(H1N1). Searching the site I found an API that I need to integrate in my app. It is swineflu-id. We need to crawl some information about influenza A(H1N1) from I have no idea how to perform a http request, not even where to start from. I need a simple app that tells us what we have or is able to tell us if we have swine flu or not. Can anyone help? Thanks in advance, Nicole Update: Is there any other way I can achieve the same? I have a project of a web service, its going to be used for a mobile application. The mobile app has to send notifications to a desktop and mobile app of the owner/user. I am going to use the Push notification and GCM. How can I combine the data of the two in a way that I get the proper notification on the ...name to the same list. The user input will be the category and the name of the event. The program should be able to search the database for events with category as the user input and the input being the exact name of the event. If the user does not input a category, the program should find all events and assign it to the category "General" The user ... Back of ticket, and download ticket to iMessage. There is only one page that the user needs to do, and at the end of that page, it sends them to iMessage with the results. App icon: [login to view URL] I don't want to copy the design. I'd like to use a different design. If you have ideas for this
