Vivia is a cross-platform software for editing multi-camera material. It's an easy-to-use interface for the editing of video material. It offers natural and intuitive editing of clips and transitions. The final project can be exported in the popular DV-encoded AVI format, or in the raw DV format, for professional archiving and further editing with other programs. Vivia also supports multiple cameras in a single project. The source files are automatically detected and organized into a hierarchical project structure, with the main camera in the root folder. The editing can be done by transferring clips between folders in the project tree, or directly to a final destination folder. Vivia comes with a plug-in for previewing the source clips and assigning captions. Vivia also supports multi-language subtitles. After the video has been edited, the project can be exported to an AVI file, or exported as a folder of raw DV-encoded files. The exported AVI file can be viewed using standard video players, such as Windows Media Player or QuickTime Player.
