There's a robot in my bathtub! I can't get this out of my head. I just watched a video by Neil deGrasse Tyson of a robot tour inside the human brain. Tyson explained all the functions of the brain. He seemed to know what he was talking about, and this at the basic level of what they know about the brain. Perhaps it's because I'm so close to what they know. He talked about the fact that some people believe the brain is a computer and some people believe it's a gene. He also discussed the fact that most people are neuromuscular specialists; their whole brain control just one or two muscles. It took me a few seconds to digest the fact that there's a robot in my bathtub. Why can't I control this robot? I can't stop the robot from going through every feature of my brain. The video shows the robot moving from the motor cortex all the way to the hippocampus and amygdala. Why can't I control the robot? How can it be that the brain could be so dumb? There's no logical way to think that every cell in my brain can be controlled by a tiny controller. If I can control my brain, then I could look at the screen, which would not allow the robot to move so freely. I think he's not making himself clear in this video. But there is a logical way to think of this. It's the same way that he controls this robot: he connects directly to the brain. His subconscious mind controls it. I really want to question this! How can there be subconscious if there's only one brain? If I can control the robot, I don't need a subconscious mind. So maybe we only need one brain. That's crazy to think, but maybe there's a reason why I don't get it. This might imply that I only need to go down so deep in my brain to control the robot. From what I know, there's a really tiny brain about 10 kilometers across that's in the spine. Can there be a tiny robot in my spine that only controls my body? If my head is controlling the robot, then it's not the right robot. If I control my spine, then I need to

Q: Why is this IIS7 rewrite rule not processing the path as expected? I have a URL `www.example.com/.../details/F01BBB`. It works fine from `www.example.com/.../index.php` I've setup the following rewrite rule on IIS7: But it doesn't seem to rewrite. I can navigate directly to the application via `localhost/.../details/F01BBB` and it works fine. Why does IIS not rewrite it? Thanks A: I have this rule in my `web.config` to ensure that authentication is still provided and the image path (without querystring) is still provided to users:
