[Islet cell antibody, insulin autoantibody and islet cell antibody-IgG determined by enzyme-linked immunosorbent assay]. Sera from 16 insulin dependent diabetic patients who had circulating islet cell antibodies, 10 with positive and 6 with negative fluorescent antibody test to human islets, were assayed for insulin and human C-peptide autoantibodies by enzyme-linked immunosorbent assay. Sera from 22 non-diabetic subjects of various origins were used as controls. All 16 patients with positive fluorescent antibody test to human islets had insulin autoantibodies. In contrast, insulin autoantibodies were found in only 5 of 10 patients with negative fluorescent antibody test to human islets. Results from enzyme-linked immunosorbent assay were identical with those of fluorescent antibody test to human islets in 13 of the 16 patients.
