Improved performance with the new 2D Crosshair: Quickly select an object by clicking and dragging within the area of the crosshair. Markups and crosshairs work together to provide immediate feedback. A new Class column in the Pane Options dialog enables you to classify the panes on your screen. Additional improvements to navigation and drawing area resizing: Drag and drop any part of a name or dimension on another name or dimension. This opens up new ways to resize objects, display information and create re-usable names. Drag and drop a point or other symbol to quickly create a multi-point anchor. These anchors are useful for placing circles, squares, polygons and any other symbol on a path. Drag a range of time to quickly set an end time for a symbol. Drag a time and the symbol will snap to the end of that time range. Additional improvements to the Layers dialog: Use the Panels and Freeform tabs to quickly toggle a specific panel or layer on or off. You can also select and deselect parts of a selected layer by clicking on individual icons. Using the tools in the Tab Strip dropdown lets you quickly switch between drawing tools. You can also add, remove or rearrange tools in the tool set. Drag and drop a string of text into a drawing to quickly insert that text. The link creation tool lets you quickly build links between related objects. For example, you can join two named lines to create a link. When you select the line, the link will automatically show a highlight. More flexibility for 3D views: Quickly change a view, pan, and zoom using the 3D Views and their buttons. You can use the Format command to save a project with the current view settings. (Previously, you could only save a project with your current view settings.) You can use the new "Icons and Camera" tool to select an area and then see the view from a camera's perspective. A new tool, the Location Compare tool, enables you to move an object in multiple directions and see how it relates to the current drawing view. Quickly swap between the Up, Down, Left and Right 3D axis by using a Context Menu command. (Previously, you could only toggle between the Up and Down axes.)
