Some days ago, I posted about my two most recent card readers. One reason why this is not uncommon is that they all share the same idea: a part of the connection is still left on the reader, and it's just this part that needs to be replaced. Why is it so easy? Because the time the connectors are exposed is minimal. Not only they are among the smallest components, but they are also the most fragile, with some plastic parts that easily break under even light pressure, and are thus somewhat difficult to repair. The advantage to this approach is that there is little chance for ever getting the connectors twisted. At least it's not my case, as the first connection of the day has just been undone in less than five minutes. The problem is the inconvenience of removing the now exposed connector - afterall, I don't have a screw driver on the table all the time. A few years ago, I built up my own home security system, to which these two little guys are connected. (I won't bother describing the details, as it probably won't be useful.) But in the midst of all this, I also bought a USB fingerprint reader, which for me is still pretty new. At least it's relatively cheap and easy to use. A quick search shows that there are probably more options in the field, and they all seem to have their advantages and disadvantages. The fingerprint reader from Passport.me seems to be the most elegant one, as it's made to look good and still a good card reader, so you do not need to throw away the old one. Maybe not suitable for those who want to expand the system by adding a webcam. It also has a problem with the nail after a while, which can be solved by running a USB cable through a USB port, but that's another problem. I'm not going to post the Passport
