This page will be updated and now it's possible to use the DATABASE of available images of the thousands of HDGs and hulls scans available (or ask for new ones! ;-)). The database is also viewable using a Google map. Here it is. The information/edition about the various HDGs and the ships they have belonged to and their current status is divided by the year they were

built/launched. If you add information to the database in any way, please send us your information so we can update this page. We try to make it easy to add information, but if you are no good at wordprocessing, you can also send us details by emailing us at hdg@hdgs.com or sending us your information in a Word/.txt file (with your name or company as the first line of the file), and we will add it to the database automatically. Thanks. HullYacht Solutions (HYS) GmbH makes available high-resolution ship scans for details like fittings and foils (including water and air passages), structural properties and shape. HYS has provided HDG-derivatives, which calculate the actual scantling structural properties of a boat according to HDGs. (Hull and Deck Grams of the Global

Organisation of Supreme Yacht Councils) The Ship Data Guarantee (HDG) stipulates that yacht owners have the right to inspection of yacht after its delivery. To register the right of inspection, yacht owners need to file a copy of the HDG-derivative with the local ship registry. HullYacht Solutions GmbH is a ship consultancy, registered in North Rhine-Westphalia, Germany. SMSI is a British publisher of books and monographs on shipbuilding, containing the design data of a ship or a series of ships of a certain type or classification. HullScant is a program that calculates the scantlings for motor boats. The program is developed with the help of steel frame design guide [2] for the design of inland boats. Structural properties such as rigidity, strength and stability are calculated for a complete structure including plating and ribs. HullScant Description: HullScant is a program that calculates

the scantlings for motor boats. HullScant is developed with the help of hullform guide book for the design of floating bridges and barges. The program calculates the plate thickness, the height of ribs, the distance between the ribs and also the scantling design parameters. HullScant is a program which allows you to calculate the scantlings for motor boats and to generate reports. This software enhances your environment by giving you a complete view of the pallet on which you are working. It can also indicate the pallet plan and the loadout, plus the resulting weight and volume. The software is also able to manage the pallet workcell that generates images for delivery or proof of delivery, and that can be printed on demand. The test pallet plan software offers a broad range of technical solutions for the execution of the test of the numerous components of the pallet. The component of the pallet whose performance must be tested can be easily selected on the

basis of its position on the pallet. In addition, the pallet can be included in order to identify the items to be tested.
