phage has proven to be a reliable model for studying the host-virus relationship in an RNA-directed DNA polymerase-dependent system, where virus gene expression is not in itself deleterious to the cell. The phage T4 structural and functional genome has been well characterized and many genetic tools, including a multiple antibiotic-resistance and conditional lethal marker systems, have been developed. In addition, the numerous powerful gene disruption systems, including bacteriophage Mu \[\[@B22]\] and transposon Tn*10*\[\[@B23]\], make it possible to efficiently disrupt target genes. Our work has greatly improved the T4 model system and facilitated its application to other T4-related systems. Methods ===== DNA manipulations ----- T4 RNAP binding site consensus sequences were deduced from known sequences \[\[@B24]\]. The mutants that have been constructed are listed in Table [1](#T1){ref-type="table"}. Plasmid DNA preparation, restriction endonuclease digestion, and T4 DNA ligase treatment were performed according to the manufacturer's instructions (New England Biolabs, Beverly, MA). DNA gel purification and PCR reactions were performed as described previously \[\[@B25]\]. Plasmid DNA minipreps were performed using Qiagen's Mini-Preps (Qiagen, Valencia, CA). DNA sequencing was performed at the MRC Protein Phosphorylation and Phosphoprotein Research Unit at the University of Dundee, Scotland.
