Since these particular neurons are the first cells generated in mammals, they can serve as model for the study of how the other cell types in the CNS are generated, for example the development of the oligodendrocytes in the spinal cord. The computer models of the molecular components of the segmentation clock, such as Notch1 and c-jun, are also of great importance for research into cancer development. For example, the stepwise development of a cancerous tumour can be traced using these models. The selective expression of genes in the CNS and their subsequent function is the basis for the development and function of brain circuits that control behaviour. Most of the
