Q: SVN commit on eclipse I am new to Eclipse for Windows. I downloaded the Eclipse from the Java web site. It didn't come with any sample code as well. Now when i try to commit some changes i get an error. Authentication failed. Please check you have entered your user name and password correctly, and that you have the correct repository permissions. I googled it, but didn't get any answer for this error. A: You need to tell Eclipse your username and password for the repository you are working with. Use the SVN Repository Manager to do so. There, you can choose the option "Add repository" and add it as described in SVN Repository Location. Then select the project you need and make sure that "Use password for authentication" is chosen. Now you can use Eclipse's SVN view to see your changes, commit them to the repository and commit them to the repository. If your project is already a repository, just use the SVN perspective and commit it as described above. [Nucleotide sequence analysis of nucleocapsid and envelope proteins of TMEV and related creol/one strain of poliovirus]. A comparative analysis of the nucleotide sequences of the N-terminal portion of the nucleocapsid protein of two closely related strains of TMEV (type 1 and 2) and one creole/one (creol) strain of poliovirus (poliovirus type 3, PV-3) was performed. The results demonstrated a general nucleotide sequence conservation of the nucleocapsid protein of TMEV strains which was partially related to their serological relationships. In contrast, as compared to the nucleocapsid protein of PV-3, the N-terminal portion of this protein of TMEV strains had specific sequence differences. These data demonstrate that different TMEV strains possess nucleotide sequences which are, at least in part, responsible for their distinct immunological relationships.

Q: What are the ground relations between an EFA and a FFA? Is there a closed formula for the number of words n for which both a 6-state EFA and a 6-state FFA have at least one accepting path starting on state q ? For the EFA, I think that to count this, we can simply sum all the paths to state q in the given EFA, and subtract the sum of all the paths from state s (the terminal state) back to q (since any other

path starting in state s is equivalent to a path from q to s), and then solve this equation for N . It would be great if this formula could be proved (or disproved). For the FFA, there may be a significantly easier way: I think the FFA might first find the minimal length k paths from state q and then use a similar formula to sum over the number of paths of length k from state q (as we did for the EFA, then we simply remove the paths of length k). A: As per page 62 of the EBNF, $M(x)$, the number of paths from state q to state s in the EFA is equal to $\sum_{k=0}^{\min(n-1,m)} 2^k m(k,x)$ where $m(x)$ is the number of minimal length paths from state q to state s in the FSM. This is the same as the number of paths from state q to state s in the corresponding FSM: $\sum_{k=0}^{\min(n-1,m)} 2^k m(k,s)$ Finally, let $m=5$, $n=6$, $k=0$. The sum is equal to $\sum_{k=0}^4 2^k 5(k)=40$. If you prefer, you can think of $M(x)$ as the number of paths from state q to state s in a graph, where all edges are weighted either $+1$ or -1 . The nodes correspond to states and the weight of the edge between q and s is $m(x)$ and is equal to the number of
