What is an image? An image is the visualization of any data, such as letters, numbers, music, photos, videos, and even thoughts and dreams. An image can be anything that exists. In computer science, an image is a digital representation of some real-world items such as an object, a photograph or a graphics, or the process of creating them. This is known as a digital image. When the source material is more than one thing or more than one part of a thing, like a series of photos taken with different exposure settings, this is known as an image sequence or image series. If each photo includes a single object or group of objects, each represented with independent color or shade, this is called a still image. Imagination plays a major part in the creation of images, even if the "image" being created is just a frame in a digital animated sequence. It can be anything from a block of pixels, or any other digitally editable representation, to a thought, to a dream. The history of images Perhaps the first images in history are those that have been found on cave walls. The Chinese may have left behind some of the oldest examples of photos, around 8000 years old. But the first recognizable images that humans created by manipulating the appearance of things may have been with the invention of photography. In 1839, Robert and William Henry Fox Talbot created the first photographic negatives using a planar glass plate, which they magnified to see the image in a camera obscura. In 1851, the dye calotype was introduced, capturing a full-sized, positive image and was the first photographic process that produced something the size of a painting. In 1856, William Henry Fox Talbot discovered the process of photolithography, and published his findings in negatives; this is how the world got to see the first large-format photographic image ever. At the end of the 19th century, engineer Charles Cros published a book of, at that time, exceptionally large photographs on lithography. At the beginning of the 20th century, the advent of the first cameras that offered the ability to take multiple images of a scene at the same time has revolutionized photography. The multi-shot camera enabled photographers to create composite images and manipulate them in post-production in new ways. In the 20th century, computer technology brought images out of the world of analog

This invention relates to a method of controlling fouling on the inside of a fixed catalyst-containing layer in a fixed bed reactor. Catalytic reforming is used to increase the octane rating of naphtha feedstreams and is an important refinery operation. Typical reforming operations are conducted in a multistage, fixed-bed tubular reactor. The reactor is usually vertically arranged from the top to the bottom of the column in which the reforming reaction takes place. The catalyst used in reforming usually consists of platinum, supported on alumina, and is located in a fixed-bed layer lying on top of the feedstream traveling in a riser portion of the reactor. In a typical reforming operation, the feedstream, after preheating, is passed through a cracking zone where the naphtha molecules are decomposed into smaller molecules containing more hydrogen, with little or no octane gain. If the catalyst contained in the fixed bed is not replaced, so that the catalyst is constantly compressed by the downward flow of naphtha, coking can and usually does occur, resulting in the deactivation of the catalyst. The upper portion of the fixed bed containing the coke is removed by burning with the hot riser discharge gas. Due to the heat of combustion, the hot spent gas is in a state of excess oxygen. The spent gas is passed through a quench and water wash unit that provides the lower temperature at which the coke burns. A layer of coke and hydrocarbon sludge then collects on the inside of the tubes of the reactor. Eventually, the sludge layer completely covers the inner surface of the tubes resulting in the loss of the heat transfer capability. This is a condition called "fouling." Catalytic reactions also tend to occur on the metal surface of the tubes and the inner surface of the tubes becomes covered with carbonaceous deposits. The formation of carbonaceous deposits is generally undesirable. They can cause a rapid deactivation of the catalyst. For example, the formation of coke can occlude the active sites of the catalyst. There are a number of methods, such as the "cutback" and "on-oil" methods, that are used to reduce the concentration of coke on the catalyst. In the cutback method, less feedstock is treated for a given cutback period of time resulting in an increased bed cutback period as well as an increase in the potential for thermal runaway. In the on-oil method, a brief period of contact with the hydro

Editorial: The Road to Green Haven Should the road to Green Haven County Correctional Facility be closed to high-speed driving, a scenario that was tested this week, the only state prison that doesn't have a maximum security wing is exempt. The route to the Green Haven prison is so tricky, riddled with county roads, fire lanes, service roads and gravel roads that some drivers avoid the whole thing. For years, advocates of the state Department of Environmental Conservation, which owns most of the county's land, have successfully pushed legislation, nicknamed the "Implementing the Grace Kennedy Road Closing Act," that would make a small portion of the county road off-limits to vehicles traveling at or above 80 miles per hour. That, the officials say, would reduce fatalities in this rural area by a whopping 70 percent, and the measure passed the Legislature last summer and was signed into law by Gov. Andrew Cuomo. The counties of Ulster and Sullivan are exempt, and only the state has the power to close roads like this. But the law also provides for a penalty — \$1,000 per vehicle — to owners of the offending vehicles. The DEC wants to close the road to 60 miles per hour. High-speed drivers have already been clocked doing 120, more than twice the speed limit, the agency claims. By the DEC's estimates, closing this road to lower speeds would be the equivalent of spending \$30 million to widen a stretch of the state Highway 17 in the area. The results, so far, have not been impressive. Since the law took effect this summer, one statistic that should be on the rise is the number of accidents where a driver was traveling more than 80 mph. Even those drivers who were not traveling at the limit have reported a marked decrease in speed. The agency offered a few reasons to support the speed limit. A vehicle traveling at 40 miles per hour is typically traveling the same distance in a shorter period of time than one going 60 miles per hour, they said. There's also the issue of safety in rural areas. The argument can be made that the most dangerous part of any journey is the last few miles to the destination — which is probably why drivers are already taking shortcuts through the woods. But as an owner of three vehicles that is over 80 years old, and a regular visitor to the Hamlet of Green Haven, I know full well that the only
