Now I need to access that database through a tool that runs on a different machine. For example, I need to access the database through MS SQL Management Studio on my Windows 7 PC. How can I access the database and make changes to the data? A: You'll need to install the SQL Server Express instance that is running on Windows 2012 in your "client" system - either run SQL Server Management Studio against that instance, or detach the SQL Express database on the Windows 2012 instance and manually attach it to your other client (I'd recommend running the detach/attach manually in case you need to make any changes). You can attach your database from the Windows 2012 using the MSSQL/xp_cmdshell stored procedure: EXEC xp_cmdshell 'ATTACH DATABASE [{db_name}] TO [{login_name}] WITH DROP_EXISTING=ON;' You can

also attach to the currently logged-in user's database using his login name: EXEC xp_cmdshell 'ATTACH DATABASE [{db_name}] TO [{login_name}];' You can disconnect the database on the Windows 2012 instance: EXEC xp_cmdshell 'DETACH DATABASE [{db_name}];'

You'll need some kind of connection string for the database. You could either connect using the ODBC or the TCP/IP protocol. More info in the SQL Server Books Online.
