Realistic hardware requirements for PCs and Macs

You'll find out what realism is in *Wars Across The World* when you can go directly into battle by simply imagining yourself in the front seat of a fighter plane or a fortress defensive tower, or even roll out on the carpet of your own mobile war station. To see what's waiting for you in your corner, you can either enter server matches for quick games or enjoy the advantages of a dedicated server: you can find out about the matchmaking process, when the match will start and how long it will take. And if all the combatant forces are out on the battlefield awaiting the commander, you can ask the server to call up sudden catastrophic events. There'll be time to prepare for the attack and even to pick up weapons, take cover or reflect the incoming shells. And in all events the duration of the combat should be sufficient for both fields to claim their aims and objectives. And when the damage goes onward, you can check the number of kills and how your combat group looks after each other. These are just a few example of quite realistic interactions of the free combat games in *Wars Across The World*.
