It has been suggested that there is a relationship between frailty and asthma.[@B1] In a cross-sectional study, frailty was associated with an increased prevalence of asthma and a reduced FEV_1.[@B1] The relationship between frailty and pulmonary function has not been specifically investigated in elderly COPD patients, but our results provide new evidence of a relationship between frailty and pulmonary function in patients with COPD. As we were not able to confirm the association between frailty and other age-related comorbidities, we cannot rule out that the association between frailty and COPD is specific for the age and smoking-related pulmonary disease.[@B26] In the first analysis of the dataset in which we were looking for factors associated with FVC and FEV_1, there was no association between the frailty index and the 2 spirometric variables. This confirms previous findings of no association between frailty and COPD-specific outcomes,[@B4] as well as frailty and chronic respiratory diseases in general.[@B3],[@B27] In the second analysis of the dataset, however, we found a strong negative association between frailty and both FVC and FEV_1. This highlights that frailty is a potent marker for poor lung function and corroborates previous findings of a relationship between frailty and lung function in COPD patients.[@B4] The pathophysiology of frailty and COPD remains largely unknown. Aging-related changes in lungs are thought to play a role,[@B28] but it
