A two-subunit SUMO-1 conjugase, whose activity is regulated by SUMOylation of the substrate, has been isolated from yeast. The suggested mechanisms of self-regulation are unknown, but the presence of a predicted helix-loop-helix motif that recognizes DNA sequences containing the core consensus sequence GG doublets and a nuclear localization signal (NLS) suggests possible binding to chromatin. The conserved regions of the N-terminus of the enzyme may act as an anti-kinase, and may be involved in the regulation of SUMO-1 conjugation to substrates. The functional significance of the substrate SUMOylation and of additional modifications remains to be determined. Deletion of the SUMO-1 gene from yeast results in the inability to grow on medium lacking histidine and is thus conditional lethal. To date, only one SUMO-1 mRNA and one putative SUMO-1 protein have been isolated; however, in vitro RNA binding assays and transcript-level studies suggest that SUMO-1 plays a role at the post-transcriptional level. The SUMO-1 gene and the genes for two other SUMOylation enzymes, UBC9 and UBC12, have been identified in Arabidopsis thaliana. The NLS consensus sequences suggest that these genes have roles in the nucleus. Magnesium oxide (MgO) is a well known material used for its electrical insulating properties in a wide variety of applications. MgO has the further advantage of being relatively inexpensive, relatively safe to process, and chemically stable at a variety of conditions. In addition, MgO is an excellent material for electrical insulating coatings, especially in the low melting-point range. It is known that MgO is very difficult to fabricate from wafers or pellet form and to obtain desired electrical properties, especially insulation resistance. The development of the Murakami process is a major breakthrough in the production of MgO. In the Murakami
