Analysis of simulated spatial pattern of a plant population by a cell-mapping model. We studied the distribution of flowering plants as a spatial pattern using a cell-mapping model. The plant considered is a winter annual outcrossing species with sib mating. The model's parameters determine the number of flowering plants and the distribution of flowering plants in space. We analyse two cases of parameter changes: the first one, when the number of flowering plants changes, and the second, when the differences of the flowering times of neighbours change. The results are given as the spatial distribution of flowering plants.

Characterization of the molecular basis of arginine and proline auxotrophy in *Escherichia coli*. The ability of *Escherichia coli* to use proline, arginine, and ornithine as sole carbon and nitrogen sources was investigated using a set of mutant strains. The molecular basis for proline and arginine metabolism was studied by the characterization of the gene product, named proU, which encodes the enzyme proline-4-hydroxylase. The proU gene has been cloned by insertional inactivation of the gene product and its sequence was determined. Mutational analyses showed that a base deletion at position 2573 in the coding sequence changes the amino acid sequence of the gene product such that the enzyme cannot catalyze conversion of proline to 4-hydroxyproline. The results of these analyses, as well as other studies, demonstrate that the proU gene encodes the only known enzyme in *E. coli* that catalyzes conversion of proline to 4-hydroxyproline. A second proline-utilizing system in *E. coli*, which depends on arginine for growth, has been demonstrated to be tightly regulated by guanine nucleotides. The studies reported here further define the regulatory system involved in regulating proline metabolism.

A Russian submarine is now stranded in a remote corner of the Bering Sea after suffering engine problems. The fate of the vessel is unknown. On Friday, the nuclear-powered Akula-class submarine was caught in a remote area of the Bering Sea as it returned to its base in the southern Russian city of Severomorsk. Shortly after the vessel was raised, it reportedly shut down its engines after the crew reported a problem with its c6a93da74d
