This research was aimed at understanding how visual disability configures the construction of identity in men with ocular disability (OD). A qualitative approach, based on interviews, was carried out. The analysis proposed the presence of three identity phases: identification, social adaptation and identity consolidation. The latter represents the configuration of the identity of a group, emphasizing the visual dimension in view of identification and social adaptation. The principal conclusion is that the visual aspects are a requisite for the construction of identity, always taking into account the characteristics of the disabled person.Memory devices are typically provided as internal, semiconductor, integrated circuits in computers or other electronic devices. There are many different types of memory including volatile and non-volatile memory. Volatile memory can require power to maintain its data and includes random-access memory (RAM), dynamic random access memory (DRAM), and synchronous dynamic random access memory (SDRAM), among others. Non-volatile memory can provide persistent data by retaining stored information when not powered and can include NAND flash memory, NOR flash memory, read only memory (ROM), Electrically Erasable Programmable ROM (EEPROM), Erasable Programmable ROM (EPROM), and phase change random access memory (PCRAM), among others. Memory devices can be combined together to form a solid state drive (SSD). A solid state drive can include non-volatile memory, e.g., NAND flash memory and NOR flash memory, and/or can include volatile memory, e.g c6a93da74d
