If the final product can't be tested, what good is it? So goes the theory of how a new physics can come to life in the minds of creators. Experiments are a great help: they can give evidence to the validity of a particular theory, and show how you can test a new view of the universe. Astronomy Tools

Actions Set Crack 20 I first got into astronomy back in the heyday of “microscope” telescopes using an 8-inch Newtonian. They were as close to having actual telescopes in those days as the typical 3.5-inch mounted on the end of a radio dish is today. Unfortunately, they also fizzled out way too early, but I still have my 8-inch

Newtonian. The second was an 18-inch Rigelian refractor. When I bought it, it was already the prize of last resort for several other enthusiasts who had no hope of finding the funds for a refractor.

Without exception, they had all thrown in the towel and resorted to CCDs. Not I. In a fit of masochistic, delusional devotion to the artform, I gave it a strong

hard crack and paid the entire (\$1,000+) cost of the two screw-down image slicers, the only type of camera that could handle the Rigelian optics. It was a revelation. Some of you may recall the good old days of the 1990s in which there was some considerable astronomy interest on the web. Back in those days, one could find all kinds of wonderful

telescopes and projects offered up on the web that were woefully underfunded. I had a page called Barcelona Star that used to have a running list of enthusiasts projects and activities. Of course, that crashed and burned in 2001. And that was with a decent-size budget.
