My first take is that Photoshop will not be for me after this update, especially when I can no longer use it to edit RAW files. I have been moving to Photoshop CC for over two years now, and I had been happy with the limitations of being able to open only PSD files without having a PSD file to open. Creative Cloud members will get a preview tomorrow though: Indeed, the exported images that I get as a result of applying the promised fixes to Lightroom 2 are very common. Most of them make sense, but when you compare them to the exported image from Photoshop CC, there is just nothing there that even remotely resembles coherent work. What saves the day and makes Lightroom truly shine is its image processing engine. If you ever wanted to retouch every single image you edit to perfection, now you can. As Lightroom is a library with layers and only an unlimited number of layers, it's pretty much impossible to touch up a single image to the way you want it. However, Lightroom has some incredible tools for retouching the work of others. For example, the layer mask areas keep track of precisely what is needed to be touched up to create a flawless image. In order to save the mask areas into a new layer, you select the 'Save' tool. This creates a new copy of the mask layers. The next step is to select the 'Redefine the edit area' tool for the areas you want to revise. Lightroom will remind you of the previous edit and you can correct everything from the outside to the inside. After this, you can find the new and pristine masked layer and merge the two. The areas that need revision can be freely merged with the original image. If you make no further changes, you can find the original layer and merge it into the original image, which creates a perfectly matched image. But that is not all. Lightroom also makes it possible to apply the new corrections together or in a series, thereby creating an even better finished product. The only problem is that, as with other Lightroom editing tools, you need a powerful machine to make use of all the features.

The Magic Wand tool is what gives Photoshop its name. It's an incredibly powerful tool that allows you to quickly select and then apply patches of color to your artwork. Once selected, the pixels that are part of an object are highlighted while those that are part of another object are ignored. I need the clone brush in Photoshop so I can apply the same color to an area multiple times. Photoshop does have a clone brush, but it's very limited in the size of patches you can copy. PhotoRealistic clone brush sizes are much larger. The Pen tool is similar to the brush tool. The Pen does have opacity settings, so you can fade in or out the parts of your images as they are being drawn. The Pen tool is great for adding hand-drawn textures to your images—I particularly love using it to add signatures to photos or logos for business cards or posters. What It Does: The Gradient tool allows you to work with color gradients. You can apply a gradient from the center to the edges of artwork. Once created, you can use this tool to add patterns to your images. The Adjustment Panel has many tools at the bottom. The Levels tool allows you to see the dark and the bright areas of your image. You can then choose to make the bright areas brighter and darker areas darker. The Content-Aware Scaling tool is the same as the Adjustment Panel's Red Eye Removal tool. It allows you to make images appear less "cartoon-like" by removing eye circles and other forms. This tool is great for removing background shapes—especially useful if you're removing background shapes from a photo of a face. 933d7f57e6
