The latest iteration of Photoshop, 2020, was released a couple of months ago. The company switched from a six-month release schedule to a quarterly release schedule. This means that a new version of Photoshop will not be released until around April each year. Like the previous year, one of my favorite features of this year's version is the seamless integration of darkroom features into the new editing workflow. With the release of Photoshop CS6, Photoshop removed a lot of the differences between its darkroom editing tools and the new editing features. The first major change will be found in the Favorites Bar on the left side of the work area. In the Editing section, you can once again find the multiple layers files you have created in the past. New to this year's version of Photoshop is the ability to see active layers in the Favorites bar alongside your most-used layers. Now, the Favorites bar shows you all of your layers at once without any clutter. Search for any of your images in the workspace and you'll see all of your layers in the Favorites bar. Automatic repair and retouching now comes with the standard edition, and you can pick between a fair amount of options to optimize your work. 3D is no longer just for rendering web pages and printed books. With the release of the update for the Photoshop CS family, you are now able to turn, say, an image of a postcard, into a 3D photo viewer with such features as geometric optics, nonconvex lenses, and curved surfaces. New cropping tools are now included. You can remove parts of an image or change the exposure, contrast, and color balance of a block of an image.
