Elements can import TIFF files and edit them without losing image quality, which is nice for printing, but where's the option to sRGB? Photoshop allows you to import files in sRGB color space, and then to convert them to Adobe RGB. Elements doesn't do this. Another apt-to-pointless bit of non-sRGB functionality is that Elements doesn't let you access RAW Adobe DNG files from Garmin cameras. And an important shot of my portfolio goes to Photoshop. When it comes to saving files in the cloud—and a lot of us are doing that—Elements is in a league all its own. You don't need a signed-up membership to download files to your computer. If you have an account at Adobe Share, you use it to save files in the cloud. It won't let you edit them, but it gives you an estimated value for images before you save them, so you can check them in or out on your own terms. There's a reason that Adobe declined to offer the feature that makes this app very cool: The hardware. Being able to edit files directly on the tablet makes a lot of sense on paper. Watch: Google Docs is built for mobile, and it works pretty well. The Adobe Photoshop can be a powerful tool, and if you need to push it to be more powerful, you might soon use the iPad Pro and the entire Adobe Creative Cloud app lineup for serious image-editing. First, you must manually import the files you want to edit into your project before you start editing. This is a pain that could've been avoided had Creative Cloud shared its saved files with other users the way Google does. Where Google Docs can instantly open your files, spot mistakes, and apply changes, your files are more like links to the file they represent, rather than the files themselves.

Native support for GPU textures, lights, and shaders; Environment maps; In-depth Gradient editor; Deep integration with the Substance materials; Compatible with all major frameworks; UI and workflow improvements In order to allow the hardware vendors to install custom firmware on their GPGPU-enabled graphics devices, the 3D features of Photoshop are transitioning to use native APIs (OpenGL and DirectX). These APIs provide more direct support for the capabilities of modern graphics cards, thus providing more consistent performance and better post-processing capabilities. This is one of the more challenging aspects of this transition, as these new features are not only embedded within Photoshop, but also through the wider Adobe product family, and their implementation is reshaping the workflow of content creators. The API transition also means a change in the ideal release cadence for these APIs - Adobe has not yet provided any timing information on the final trends.
