Lightroom is a powerful image management application. It's also the program that performs image editing functions such as sharpening, removing noise, and correcting color. While it can be applied to raw images, it is considered a separate, but very useful, application as well. Definitely a must-have application for pro photographers and many who are serious about enhancing their images. Lightroom constantly receives updates and changes every year. The most recent version of Lightroom is 5. In this post, we will look at Lightroom 5's major new features as well as their relevance. We will further look at Lightroom in general. Since I had the opportunity to test it and review it, I've been using the new Adobe Lightroom 6. It has crashes now and again. It's also dropped a few items (not all, but some), but that's not why I'm writing this review. I originally bought the application because I needed an easy way to create slideshows of images I take with my iPhone. It's designed specifically for this purpose because it's easy to use and convenient. In a world where a myriad of screen resolutions and graphics cards are being created, Lightroom maintains a pretty solid standard. Color grading options are fairly abundant and generally functional. It also supports organizational features conducive to creating slideshows. And it's easy to create with. It's pretty easy to get setup. However, rather than put all of my images into one folder, I created several folders. They were initially designated as "Event 1", "Event 2", and so on, in order to name categories without having to type out the entire name.
