Given away already in V.2.9 of Lightroom, the Improving Performance document was followed up with the Deprecating Elements Libraries document. This is another example of where the roadmap is less about what will happen but more about what could happen and why. Most of the performance improvements relate to how the libraries are used and how the memory-intensive transformations are performed. The design of the Lightroom application itself is being reworked. As was discussed in the “System Requirements” section, Lightroom 5 needs twice the amount of memory. The reason is that, with Lightroom 4, the entire catalog needed to be kept in memory at any one time. In Lightroom 5, Lightroom needs to keep track of where you are as you keep working, and you need to keep track of where you are to be able to tell Lightroom where to go next. The new release of Lightroom also gets rid of being able to create a new library. It’s a very bad idea. It’s good for a very short time. Forget about it. One of the major reasons why we can no longer create new libraries is because we don’t need that option. These are already available on the Airfield, however, you are able to take your project and save it to your Cloud service, as long as you are on the main menu of the application, and not in a library or folder. The application has a fast performance, sorting and moving of folders can be a bit slow, but it is fast. Airfield makes it simple to import and export files. New projects can be added simply by clicking an empty space in the side menu bar. After that, press the + to add a new page to the existing roll and starts with a blank slate, so to speak, though if you use the pen tool you will be able to make things fit the screen just fine. Added pages can be simply dragged and dropped into any panel on the main screen, and simply removed by clicking an x on the corner.

The sidebar has been a valuable part of Adobe Photoshop for more than 20 years. By lifting the sidebar and integrating it with the content area, you can start from anywhere within your canvas, select the content area on which to work, and manipulate content without having to pull up a separate window. Adobe Illustrator also offers a similar feature. With the creative release of CS6, the Sidebar will return in versions 2019 and later. In the meantime, users may also access and edit content on the fly using Direct Select or Layer Styles toolset. The lack of an easy way to organize your work caused artists to rely on hard-to-remember filenames and folders to store their files. Recently, Adobe added a feature called "Untitled" in Photoshop, which helps artists find files more easily by grading the files with a unique ID. You can even auto-rename your files, but be sure to check for any conflicts with file names before you create the perfect filenames. The marketplace has become a powerful way to connect artists with top-quality tools. In addition to providing a direct connection through Creative Cloud, Adobe Illustrator and Photoshop Online also offer access to the full feature set and compatibility with your critical assets and workflows. In all of the post-production workflows at the studio, we use a combination of Adobe Stock and Adobe Vectors. We were looking for a way to easily integrate Adobe Stock images into our existing workflows so that we could easily change images without having to return to an external source. Adobe Stock now natively integrates into Adobe Creative Cloud, allowing you to purchase native high-resolution images right from

within the application. While there is a feature to upload high-resolution images, native integration with Adobe Stock allows you to see what you will receive, before you place an order.

The latest feature set for Adobe Photoshop CS6 was released in 2016, which coincided with the launch of the Creative Cloud Photography package (then called Photoshop Elements). It introduced a number of complete (and some partial) overhauls of some key features, full-featured apps, and even added native support for Retina displays. Among the new features is **Photomerge-like automatic collage** feature and an add-on module for Photoshop called **Layer Merge**. There are also new tools for refining and combining layers, along with a new option to lock or un-lock layers and groups of layers. This also brings a mobile-first experience to the tablet-mainstream, which was missing from the previous versions. The newest update was made available at the start of 2019, added to Photoshop CC 2018. The update includes the ability to create and update Photoshop Layers 2.0 in conjunction with other tools, allowing Adobe to offer the option of tracking changes to a layer and automatically updating any changed layers in the paint bucket of a bitmap. There are also a number of tools for navigating and working with image collections, including support for collections on mobile devices. In addition to APIs, with the migration to the native GPU datastructure, we are also able to do many more optimizations for fine detail, greatly improving its performance on the GPU - use Modern GPU datastructure for a summary, or check out this comparison of the old and new Noitom animation packages. This is the second new update in a row to include a strong emphasis on performance; not only do we have a lot of new performance, we also introduced totally new optimizations such as a more robust raymarching raytracing pathtracing and simd pathtracing - these are all performance-heavy features.
