Other tools added to the library include a Histogram and Levels. Speaking of levels, Lightroom 5 adds Zebra Striping as an automated way to detect out-of-range pixels. This feature is something we had addressed two years ago in a reply to a comment in an earlier review called "Lightroom Advanced User's Guide". However, this feature is still marked as Beta. Where it truly shines is in the sharing of your projects with others you know. Adobe has added the ability to share your edits directly to a single person or to many folks simultaneously. The whole point of these edits is that you want to hand them off to other users, correct a few things for approval, and have them modify further edits. Of whatever you create, you want as little control as possible over your work—that's why you shared it. What's great about the Share for Review feature is that it works for photos, video, and videos. You can also share with other clients, and this too can be done easily via the share tab—which highlights all the images and videos in a smart way. From there, you can simply download the project. You can also send emails and messages attached. Lenses has been updated, too, with the addition of Curves. This is a powerful tool which helps you to adjust intensity, contrast, and saturation. For example, if you are not satisfied with the way your image has degraded upon resizing, you can make some basic corrections by using it. If you are not happy with the way you enhanced the skin tones, for instance, you can use Curves. If you want to remove that blemish from your friend's head, The Lens Correction tool, too, has been fine-tuned. A further new addition is the opportunity to create file types based on camera-specific and profile-based settings. As I demonstrated in the video below, this option allows photographers to choose between their files being easily made into backups or to develop specific settings for Post-Capture work. Exporting also gets some love. Be it the Information bar or the Metadata panel, you'll find additional buttons and arrows allowing you to preserve the number of frames or their order, or to ensure that a particular timecode gets sent with the images.

Jan Skubis, global head of Creative Cloud, said, "The image editing world has historically relied on cameras, tools and software vendors to create a standardized set of performance metrics and guidelines. Photoshop is uniquely equipped to leverage that approach with a machine-learning-driven system that will allow it to adjust to new and different types of camera sensors. With a standardized camera-to-photoshop workflow, users will be able to quickly get the most out of their photos using the camera that they have, contributing to our goal of making Photoshop the all-in-one solution." The share workspace introduced in Photoshop CS7's Photoshop Elements added a workspace and tools to work with people within the same application, but selections made in the PS tools were still stored locally. With the Share workspace, artists can create a shared selection of their files to work on concurrently rather than store data and files locally. The separation of the data and files allows for incredibly convenient and secure sharing of selections. Artists can also view all the selections and check out the process for edits, while the original file is maintained. Today's commit includes two major improvements to selections in the 16-bit LAB with 8-bit alpha channel. These 100+ years of improvements in selections are essential to the breadth and depth of photo editing in Photoshop. Adobe Sensei AI, the machine-learning-driven facial recognition engine that powers Photoshop for AI editing in the Creative Cloud apps, will expand the ability to leverage these improvements with the addition of new face detection technologies. The traditional rectangular selections used for depth multiple corrections will now be able to elegantly keep the option to select more than one area when using the Lasso selection tool. With the innovative Intensity-Based Selection tool and the new Select Faces functionality, users can create more reliable selections based on faces within images. These improvements mean that users will get more accurate selections when editing images.

The Professional version of Adobe Photoshop has been a leader in the photo industry since its inception. Anyone who owns a DSLR or mirrorless camera is familiar with the power and the versatility of this suite of editors and filters. The software is synonymous with some of the finest automatic effects and processes that photographers have ever seen, and for professional digital photographers, it has been the standard for a quarter century. However, the full-featured professional version of Photoshop is priced at $649 (around AU$875) per year for anyone who uses it, and is currently priced as high as $6,000 for students (around AU$7,845) and $18,000 for business users (around AU$24,735). Photoshop for Mac is a great companion photo editing app to Photoshop on Windows. For those who need a solid and reliable alternative to Photoshop on their Mac, it has everything you need for everyday content-based photo editing, as well as faster editing. The Mac version of Photoshop is better than using apps like iMovie to create videos and snaps, it doesn't have a full-featured image editor like Lightroom, and Photoshop is a simpler alternative. Photoshop for Mac is compatible with all Mac devices, but it will not work on Mac devices that do not support macOS Mojave, 10.14. Photoshop Elements for Mac is the ideal Mac app for those who are looking for a free alternative to Photoshop on macOS. It doesn't have all of Photoshop's features and tools, but it does offer a rich array of editing options at an attractive price point. Elements is also very easy to use because it is built on the same foundation as Photoshop on Windows: People who

use Elements will feel right at home with the app.
